PeopleDesk
HUMAN RESOURCE MANAGEMENT SYSTEM

Full-Stack Project Submission Report

Implementation overview, testing summary and UI evidence

PREPARED BY

Aprajit Roshan

Project: PeopleDesk HRMS

Date: 14 October 2026

SOURCE REPOSITORY

github.com/AprajitRoshan/peopledesk-hrms

PROJECT STACK

- React + Vite
- FastAPI + Python
- MySQL + SQLAlchemy
- JWT + SMTP

Prepared from the current project files and user-provided local verification evidence.

Project at a glance

PeopleDesk HRMS is a full-stack Human Resource Management System built for the assignment scope: employee operations, attendance, leave requests, payroll processing, salary slips, email notifications, reports and administrative auditability. This report consolidates the implementation overview and evidence from the local walkthrough completed on 14 October 2026.

PROJECT	PeopleDesk HRMS	**REPOSITORY**	github.com/AprajitRoshan/peopledesk-hrms
FRONTEND	React, Vite, custom CSS	**BACKEND**	FastAPI, Python, SQLAlchemy
DATABASE	MySQL (hrms_db)	**AUTH / EMAIL**	JWT, password hashing, SMTP

Application architecture

REACT + VITE UI	FASTAPI REST API	SQLALCHEMY + MYSQL
Admin and Employee workspaces; payroll, reports, documents and notification views.	JWT authentication, role checks, validation and feature routers.	Persistent users, employee profiles, attendance, leaves, payroll, documents and logs.

Notification path: application events create notification-log records; when SMTP is configured, the service attempts delivery and records the result. The current walkthrough shows a new leave notification as Sent and a corresponding email received.

Document handling: the UI accepts PDF, PNG and JPEG files up to 5 MB and exposes authenticated download actions.

Functional coverage

The following matrix maps the assignment requirements to the features demonstrated in the current application and the verification evidence available for this report.

AREA	IMPLEMENTATION / EVIDENCE	STATUS
Authentication & roles	JWT login; hashed passwords; Admin, HR and Employee role choices in role-management UI; protected API access tested.	**Verified**
Employee management	Create and list employees; update employee profiles; active/inactive account controls; employee directory.	**Verified**
Attendance	Employee check-in/check-out and history; administrative correction; timestamped audit entries.	**Verified**
Leave management	Leave applications and tracking; Admin approval/rejection; leave balance display; approved unpaid leave used for LOP test.	**Verified**
Payroll & salary slips	Monthly salary processing, manual adjustment control, record locking, simulated credit, PDF download.	**Verified**
LOP calculation	November test: INR 45,000 base salary, 2 LOP days, INR 4,285.71 deduction, INR 40,714.29 net.	**Verified**
Notifications	Template-based event records; SMTP setup; new leave notification status Sent; corresponding email observed in Gmail.	**Verified**
Reports & exports	Attendance, leave and payroll summary; date, department and pay-period filters; CSV and PDF export actions; CSV opened in Excel.	**Verified**
Document handling	Admin employee-document view; employee upload/download of a PDF; saved document displayed in UI.	**Verified**
Audit logs	Read-only UI with timestamped employee, attendance, leave, payroll and document events.	**Verified**

Technical controls and caveats

The project uses protected REST endpoints and role checks for restricted operations; request validation and secure file upload constraints are included. This is an assignment prototype rather than a production deployment: production hardening would typically include migrations, automated test coverage, rate limiting, hardened session storage and deployment-specific secret management.

Verification summary and handover

Checks below were run locally by the developer or shown in the submitted screenshots. This report records those results; it does not claim that the application was independently run in the PDF-generation environment.

CHECK	OBSERVED RESULT
GET /api/health	200 OK; response reports status ok and service HRMS API.
GET /api/health/db	200 OK; response reports database connected.
Admin login	200 OK; admin user/role returned. Sensitive token screenshot intentionally excluded.
Frontend production build	Vite build completed successfully (23 modules transformed; production assets emitted).
Python compilation	python -m compileall app completed across application directories without a syntax error shown.
SMTP delivery	One fresh leave-applied event was marked Sent; corresponding email was observed in Gmail. Three older records remain Logged Only from before SMTP setup.
Payroll lifecycle	November payroll: Processed -> Locked -> Credited; simulated credit confirmation displayed.

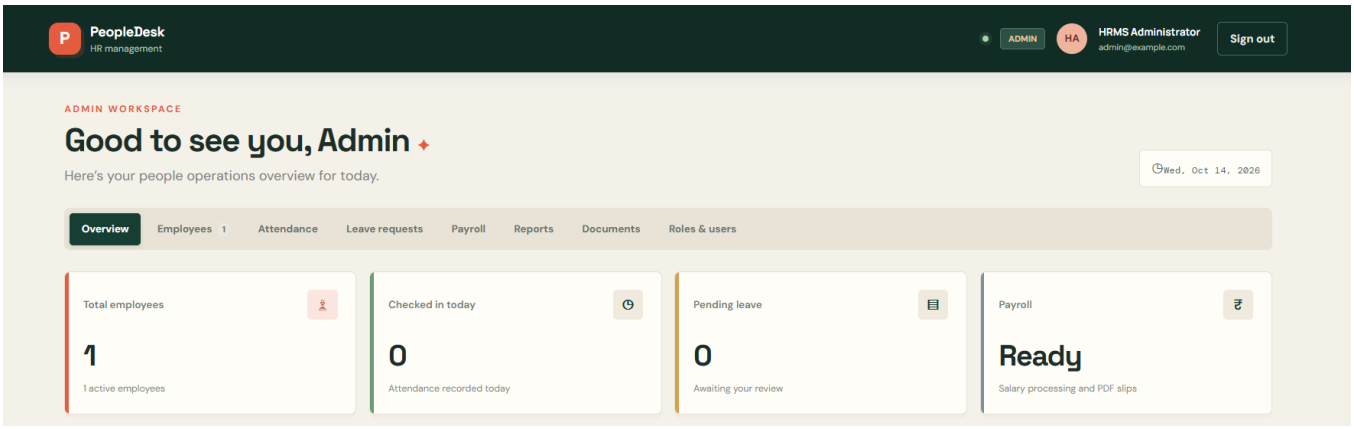

Local run instructions

BACKEND	From D:\Stackly_training\hrms\backend: activate the existing venv, install requirements if needed, then run **python -m uvicorn app.main:app --reload**.
FRONTEND	From D:\Stackly_training\hrms\frontend: run **npm install** if needed, then **npm run dev** and open the Vite URL shown in the terminal.
CONFIGURATION	Keep local values in backend/.env. Do not commit database credentials, JWT secrets, SMTP passwords, access tokens or private employee files.
POSTMAN	Postman assets are stored under postman/. Local Mode currently uses the v3 YAML request format. Run read-only requests first; avoid replaying create/process/approve operations against existing demo records.

Private handover items: share the MySQL dump and Admin/Employee credentials through the assignment-approved private channel. They are not part of the public GitHub repository. The local database export was confirmed created on 14 October 2026 and excluded from Git tracking.

Evidence 01 - Admin workspace

The Admin landing page establishes the PeopleDesk navigation and high-level operational overview. This crop focuses on the heading, feature navigation and summary cards.

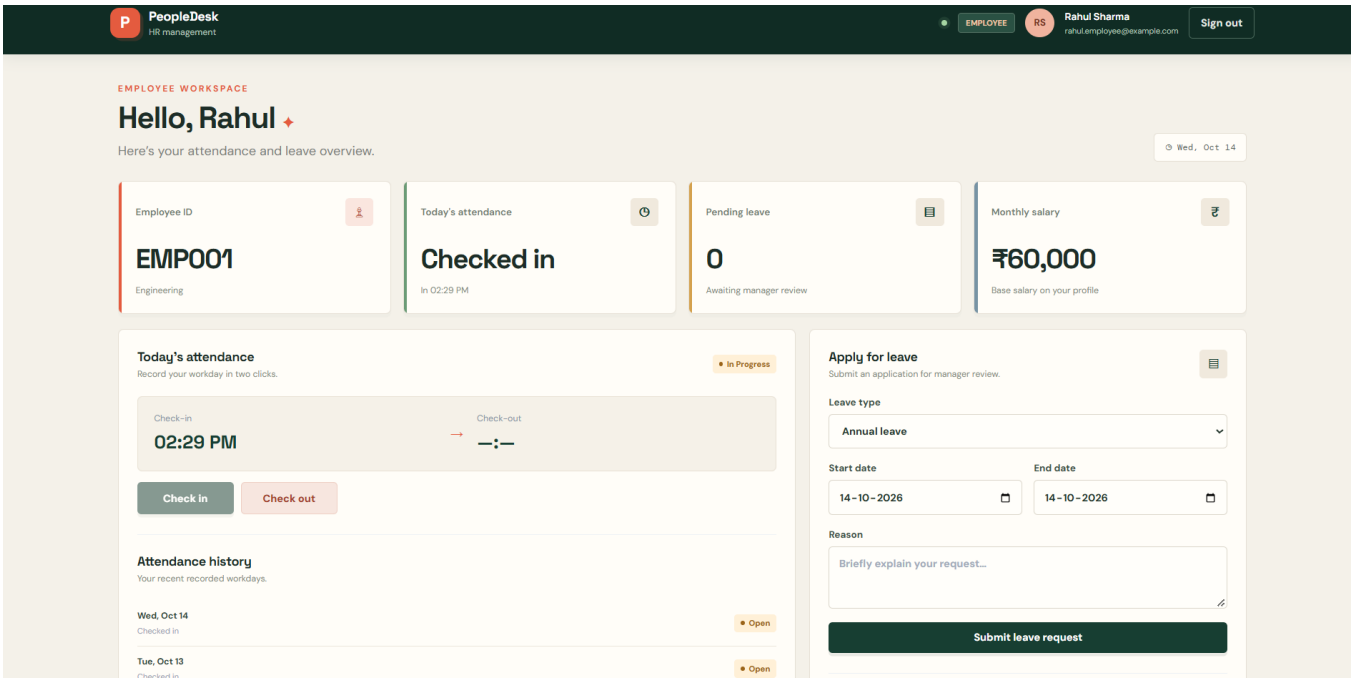

Admin navigation sections visible in the current build include employee directory, attendance, leave requests, payroll, reports, documents and role/account management. The Notification Log and Audit Logs tabs were subsequently added and verified in the later screenshots in this report.

Design note
PeopleDesk uses a warm ivory workspace, forest-green header and navigation, and coral highlights - a distinct visual treatment from a standard gradient-card admin template.

Evidence 02 - Employee workspace

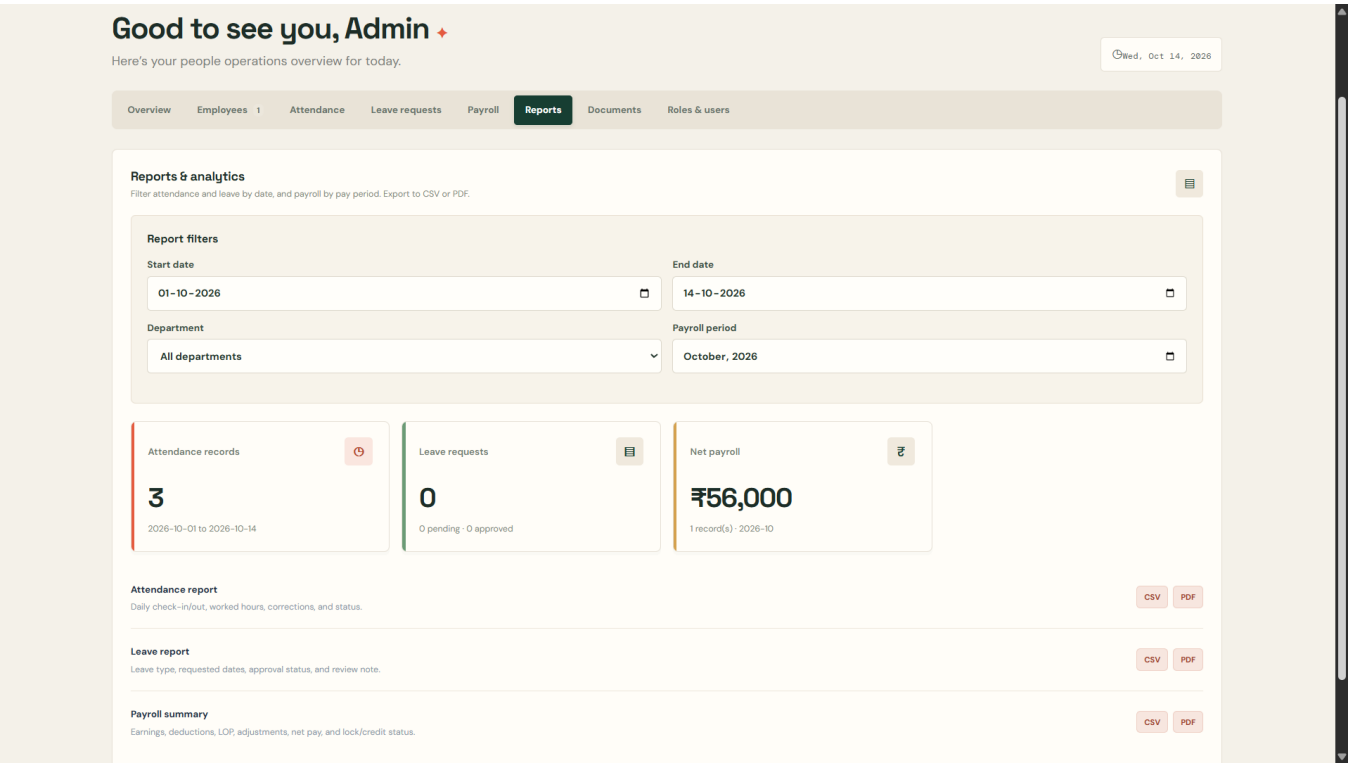

Employee portal evidence shows the employee identifier, current attendance state, profile monthly salary, leave application form and recent attendance history.

The displayed monthly base salary was updated to INR 60,000 and confirmed in the Employee workspace. Salary slips and employee documents are available further down the portal.

Evidence 03 - Reports and analytics

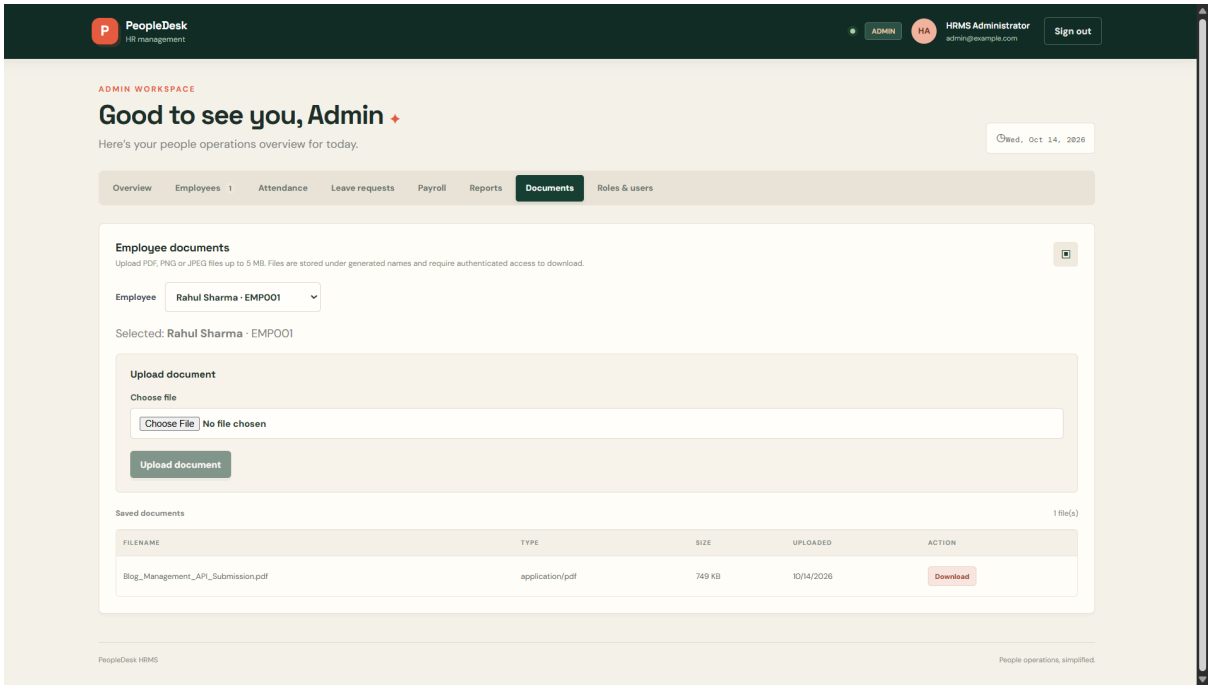

The Reports & Analytics screen exposes the requested date range, department and payroll-period filters and provides CSV/PDF actions for attendance, leave and payroll summary reports.

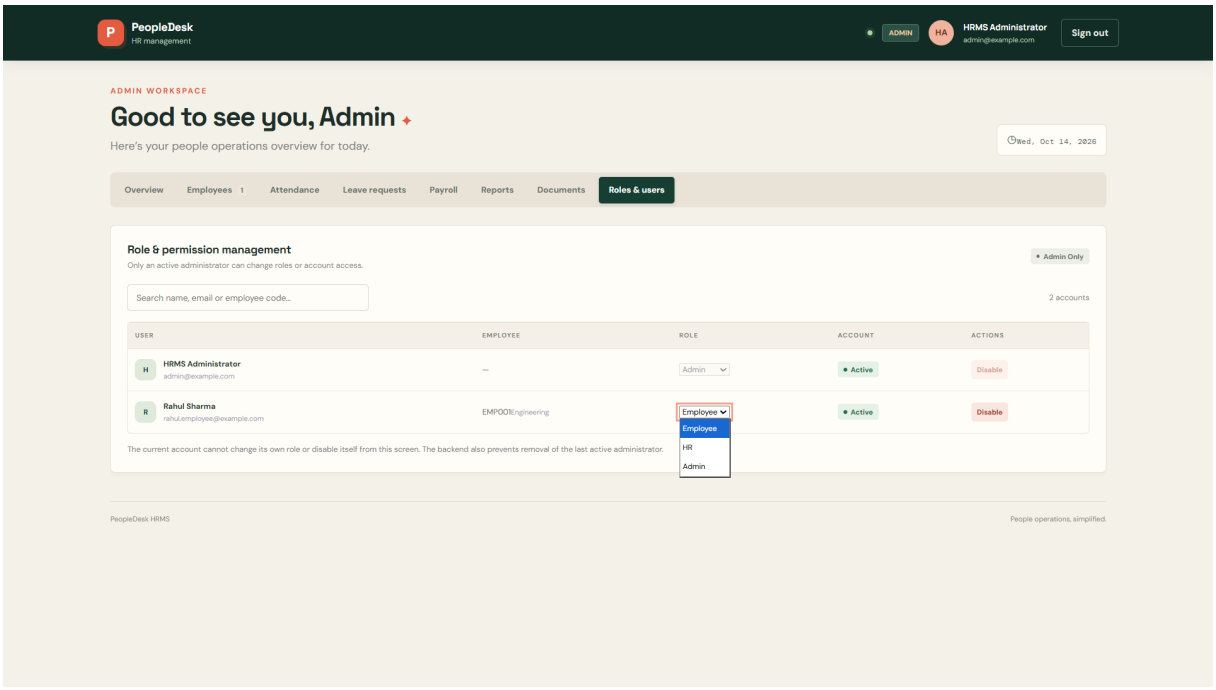

Additional evidence supplied during testing includes the exported attendance CSV opened in Excel, plus attendance, leave and payroll report export files stored in the local submission folder. Report data files are kept outside the public repository.

Evidence 04 - Documents and role management

The Admin document view allows selection of an employee and lists uploaded files with file type, size, upload date and a download action. The role-management UI exposes Admin, HR and Employee role options and account activation controls.

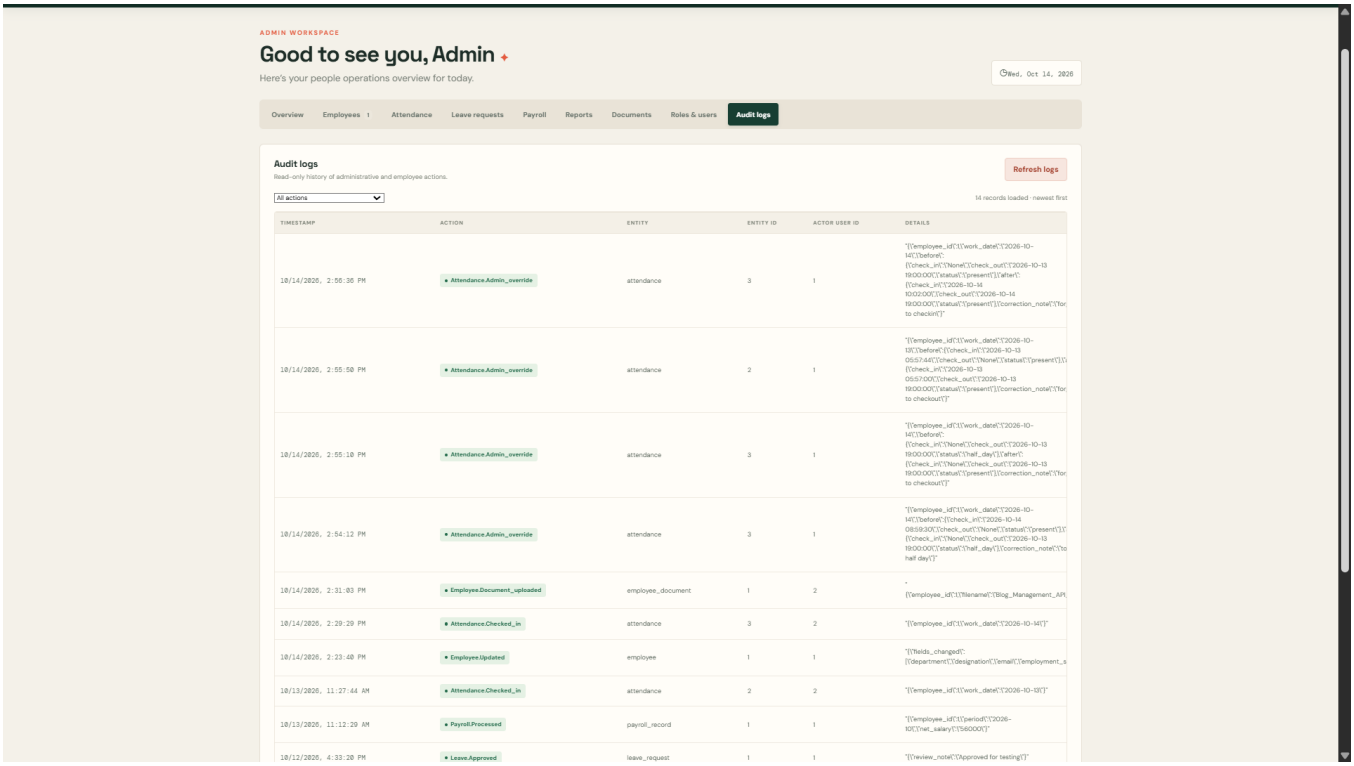

Employee documents view: PDF upload and authenticated download UI; one saved test PDF is shown in the captured state.

Roles & users view: existing Admin and Employee accounts, role selector and disable-account actions. The current administrator cannot change its own role or disable itself from this screen.

Evidence 05 - Read-only audit logs

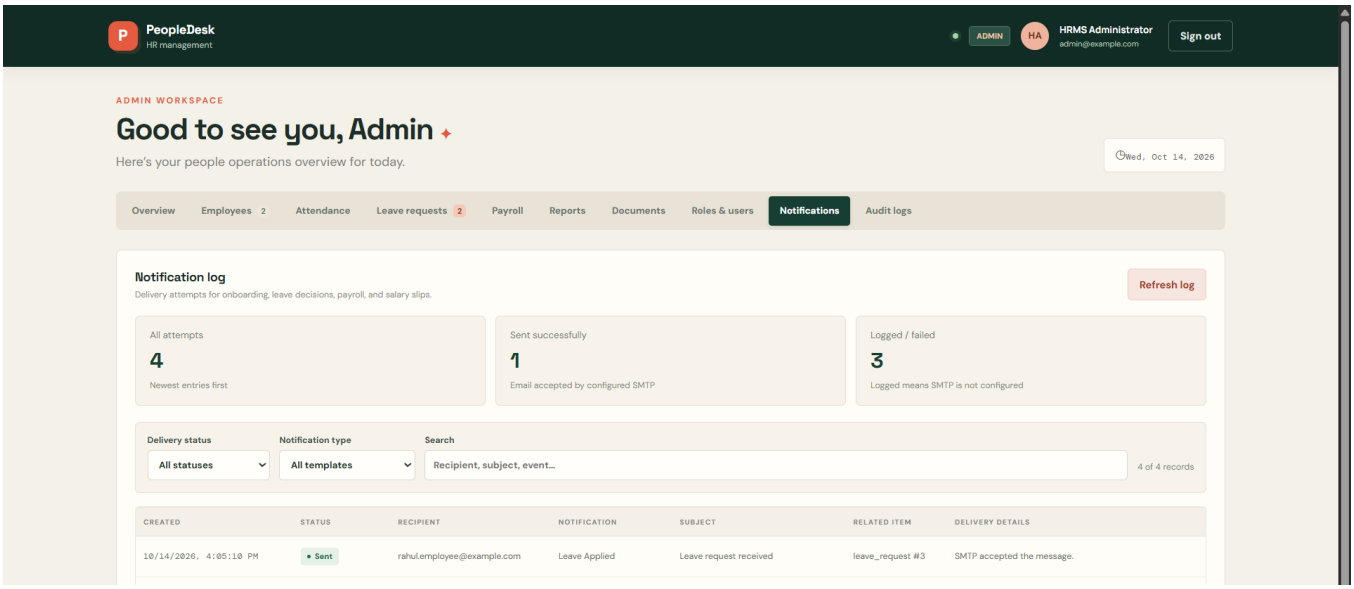

The Audit Logs screen loaded 14 records in the captured state, newest first. Visible event types include attendance admin corrections, employee document upload, attendance check-in/out, employee updates/creation, payroll processing, and leave application/approval.

The UI explicitly describes the log as read-only and does not expose edit/delete actions. Event details are serialized JSON in this version and could be made easier to read in a future polish pass.

Evidence 06 - Notification log and SMTP delivery

The Notification Log records onboarding, leave, payroll and salary-slip notification attempts, including timestamp, status, recipient, related record and delivery details.

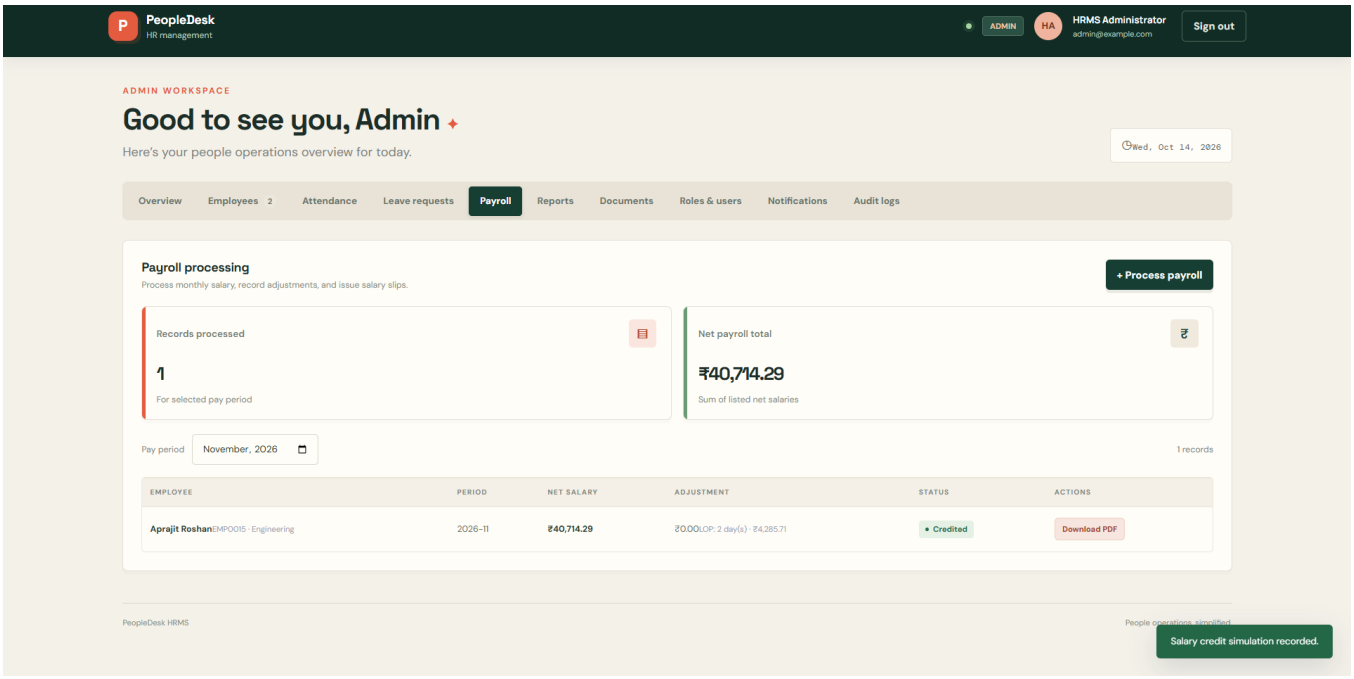

Confirmed outcome: after SMTP was configured and the backend restarted, a fresh leave-applied notification showed status Sent with delivery detail “SMTP accepted the message.” A corresponding “Leave request received” email was observed in Gmail.

Three older attempts remain Logged Only because they were recorded before SMTP was configured; they were not automatically resent. The status shown for the new event is the proof of successful configured SMTP path.

Evidence 07 - Payroll, LOP, locking and simulated credit

The November 2026 payroll record for Aprajit Roshan (EMP0015) was processed, locked and then credited through the application’s simulated salary-credit action. No real bank transfer is performed.

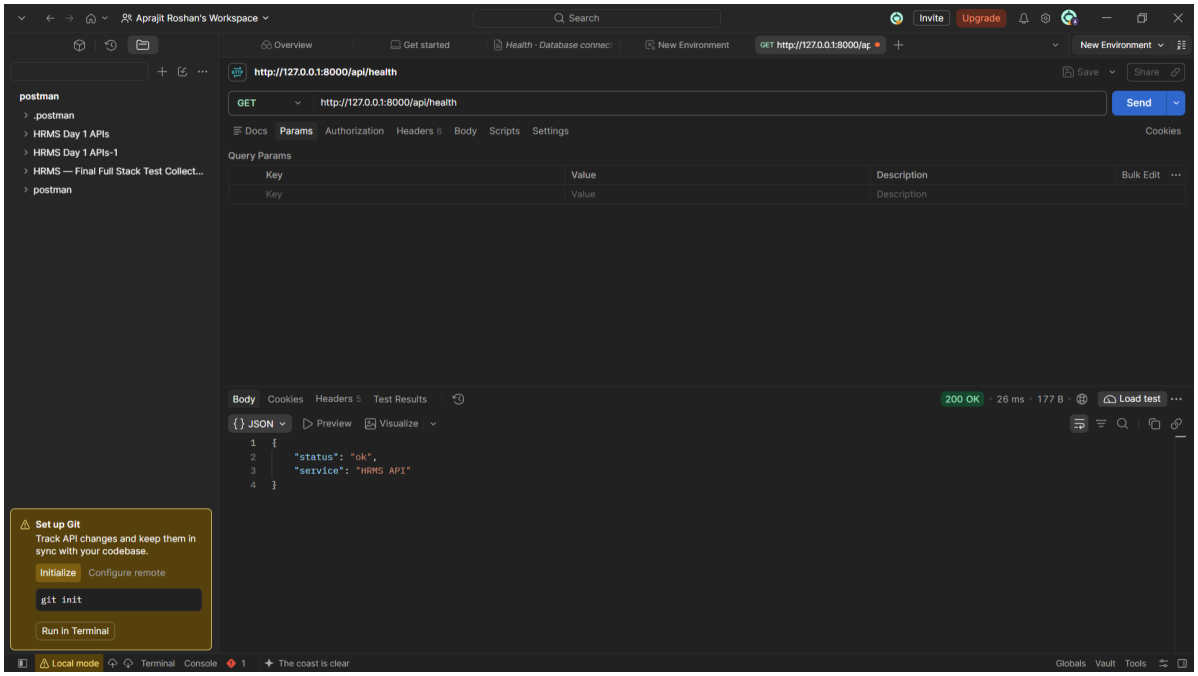

SALARY COMPONENT	AMOUNT
Base salary	INR 45,000.00
LOP days	2
LOP deduction	- INR 4,285.71
Other deductions / adjustment	INR 0.00 / INR 0.00
Net salary	**INR 40,714.29**

LOP calculation matches the generated sample salary slip: INR 45,000 / 21 weekday divisor x 2 days = INR 4,285.71 (rounded). Net salary is INR 40,714.29. The original generated slip is included in Appendix A and is also supplied as a separate PDF.

Evidence 08 - API and database health checks

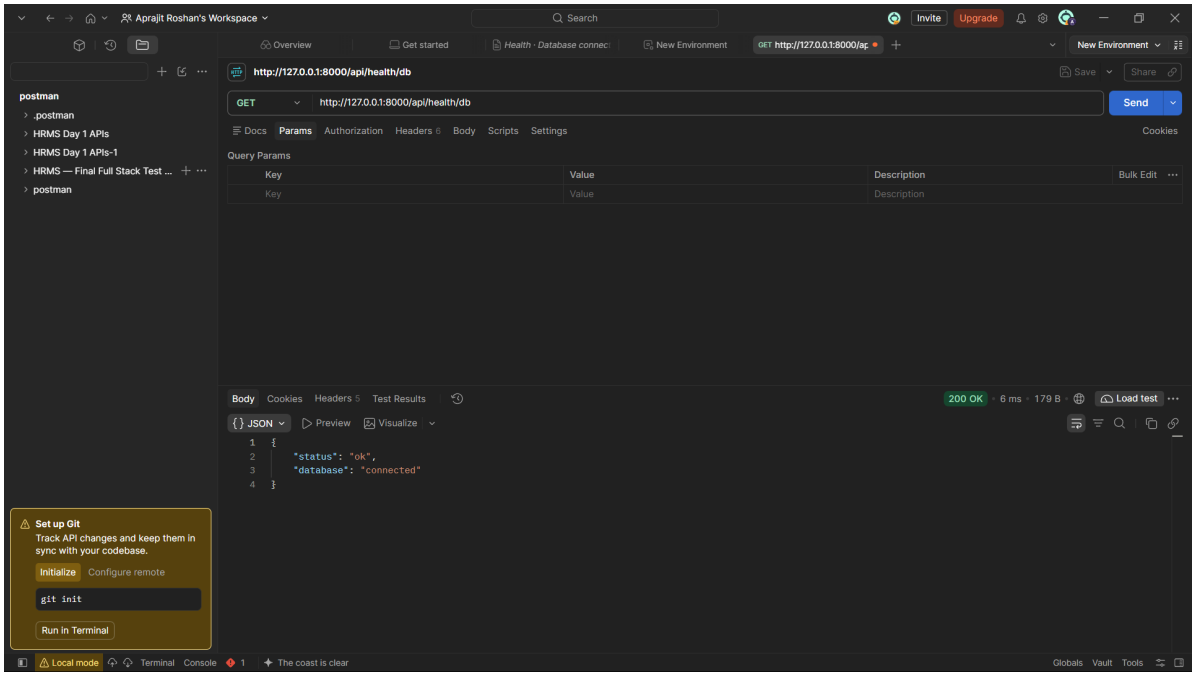

Postman requests were run individually against the local FastAPI service. Both health checks returned HTTP 200 OK.

API health: GET http://127.0.0.1:8000/api/health

Response: status = ok; service = HRMS API.

Database health: GET http://127.0.0.1:8000/api/health/db

Response: status = ok; database = connected.

Submission handover checklist

Use this page with the public GitHub repository and the private assets generated locally. Keep credentials and the SQL dump separate from public source code.

DELIVERABLE	LOCATION / HANDOVER NOTE	STATUS
GitHub repository	https://github.com/AprajitRoshan/peopledesk-hrms	**Published**
Source code	Frontend, backend, README, database schema, Postman request definitions and submission checklist in repository.	**Published**
Database schema	database/hrms_schema.sql in repository.	**Published**
Database dump	Local file: database/hrms_db_dump.sql. Keep separate and deliver via the assignment-approved private channel.	**Local/private**
Postman collection	Postman assets under postman/. Local Mode collection is represented in v3 YAML request format after conversion.	**Included**
Admin / Employee credentials	Use submission/CREDENTIALS_PRIVATE.md locally or a password manager; never commit/share credentials in the PDF.	**Private**
Sample salary slip	salary-slip-2.pdf (separate file); this report contains the summarized salary breakdown.	**Prepared**
UI and testing evidence	Screenshots are embedded in this report; CSV/PDF report exports remain separate local artifacts.	**Included / local**

Final security checklist

• Public GitHub does not track backend/.env or database/hrms_db_dump.sql.

• Private documents, evidence screenshots, report exports and salary-slip PDFs are excluded from the public repository by .gitignore.

• Admin password and JWT secret were rotated after a test screenshot exposed a token/password; use only the updated local credentials.

• Share the DB dump and current Admin/Employee credentials privately with the reviewer; do not include them in this PDF or a public repository.

Project repository: github.com/AprajitRoshan/peopledesk-hrms

This report documents the implementation and local evidence supplied during the project walkthrough. It is a submission summary, not a formal security audit or production-readiness certification.

Appendix A - Generated sample salary slip

The next page reproduces the original one-page salary-slip PDF generated by the local PeopleDesk HRMS application. The values below match the November payroll evidence in this report.

FIELD	VALUE
Employee	Aprajit Roshan (EMP0015)
Pay period	November 2026
Base salary	INR 45,000.00
LOP days / deduction	2 days / INR 4,285.71
Net salary	**INR 40,714.29**

The salary credit status in this application is simulated; no bank transfer is performed. Keep this report and the sample salary-slip file in the private assignment submission channel, not in the public source repository.

PeopleDesk — Salary Slip

Pay period: **2026-11**

Employee Details

Employee	Aprajit Roshan
Employee code	EMP0015
Department	Engineering
Designation	Software Engineer
Email	aprajit.roshan@gmail.com

Salary Breakdown

Component	Amount
Base salary	INR 45,000.00
Allowances	INR 0.00
Other deductions	- INR 0.00
LOP days	2
LOP deduction	- INR 4,285.71
Attendance days	0
Paid leave days	0
Manual adjustment	INR 0.00
NET SALARY	**INR 40,714.29**

This is a system-generated salary slip. Salary credit status is simulated in this application; no bank transfer is made.
